The invention describes inhibition of mammalian epithelial cell
proliferation by treating cells with at least one oligonucleotide, or
its fragment. The compounds, which have cytostatic, anti-allergic,
anti-inflammatory, dermatological, ophthalmological, anti-apsoriatic and
immunosuppressive activities, function as 'ultra-violet mimics' to induce
the constant processes (or a protective response to later exposure to
radiation or chemicals), as a proliferation inhibitor, apoptosis inducer
or a tumour necrosis factor inhibitor. Probably they mimic products of
DNA damage, or processed DNA-damage intermediates, by inducing the p53
pathway, resulting in transient arrest of cell growth, allowing more time
for DNA repair to occur before cell division takes place. The method is
especially used to treat carcinoma but may also be used to: treat other
typerproliferative states (e.g. psoriasis or precancerous conditions);
reduce photoaging, oxidative stress or damage; prevent skin cancer; treat
allergically mediated inflammation (atopic or contact dermatitis,
allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in
cells caused by radiation or chemicals; increase melanin production
(pigmentation) in epithelial cells (e.g. for treating varialing), and to
promote apoptosis in epithelial cells that contain damaged DNA, Also

oligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligonucleotide #4, a truncated version of the oligonucleotide shown in AAS14906, one of the oligonucleotides shown in AAS14916 into eithe proliferation, described in the method of the invention.

diseases, treating psoriasis, vitiligo, atopic dermatifis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer. AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV minetics and protect cells against subsequent exposure to UV.irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative DNA fragments useful for increasing p53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases -Claim 11; Page 30; 44pp; English Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes inhibition of mammalian epithelial cell trafferation by treating cells with at least one oligonuclectide, or proliferation by treating cells with at least one oligonuclectide, or its fragment. The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, ophthalmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce company processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptossis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in translent arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other of or DNA repair to occur before cell division takes place. The method is especially mediated inflammation (atopic or contact dermatitis, reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (atopic or contact dermatitis, allergically mediated inflammation (atopic or contact dermatitis, allergic rhinitis and conjunctivitie); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells that contain damaged DNA. Also coligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cells cellibulial cell proliferation, cinhibit mammalian epithelial cell proliferation,
                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Melanin; melanogenic; oligomer; cytostatic; anti-allergic; p53; anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; immunosuppressive; DNA repair; proliferation inhibitor; apoptosis; tumour necrosis factor inhibitor; photoaging; hyperproliferative disease; carcinoma; oxidative stress; skin cancer; allergy mediated inflammation; conjunctivitis; allergic rhinitis; vitiligo; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light
                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligomucleotides are are UV mimetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligomucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhimitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA fragments useful for increasing \mathfrak{p}53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light

Claim 1; Page 36; 74pp; English.

The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-inflammatory, dermatological, ophthalmological, anti-ipsoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other hyperproliferative states (e.g., psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells (e.g. for treating vitiligo), and to promote apoptosis in epithelial cells that contain damaged DNA. Also oligonuclectides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligonuclectide #3, a truncated version of the oligonuclectide shown in AAS14906, one of the oligonuclectides used to inhibit mammalian epithelial cell proliferation, described in the method of the invention.

The present sequence represents a promoter regulatory element, found in the utrons of the invention. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that stimulates or inhibits a cellular response by sequence specific interactions. The utron is able to suppress constitutive and interferon-gamma (IFN-gamma) induced major histocompatibility complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (WHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I are class II antigen expression. Such utrons can be used to regulate species on in a subject, e.g. a human or a cell in vitro, specifically inhibiting MHC class I or II. ICAM-7, B7-1, B7-2, RC gamma R, II-2 or HIV gene expression. They can be used to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ransplant rejection, or treat an autoimmune or inflammatory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Utrons, RNA molecules containing promoter regulatory motifs -useful to suppress express expression from promoter of interest, specifically TSU nucleic acid suppression of MHC Class I and II gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                 3' untranslated region, UTR; inhibition, gene expression; ICAM-7; interferon-gamma; IRN-gamma; major histocompatibility complex; MHC; antigen expression; gene promoter; urron; B7-1; B7-2; Fc gamma R; HIV gene expression; transplant rejection; treatment; autoimmune disease; inflammatory disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                        A promoter regulatory motif found in the utrons of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent discloses non-integrating viral vectors comprising a polynucleotide flanked by inverted repeats that bind a transposase, a transposase-encoding polynucleotide operably linked to a regulatory sequence comprising an operator, that alters expression of the transposase-encoding polynucleotide. Transposon sequences can integrate into genomic DNA whether or not the cell is dividing. Ad8810 is a SB (Sleeping Beauty) transposase-transducing adenoviral non-integrating vector. The non-integrating viral vectors are useful for treating to append to disease characterised by subnormal production of a polypeptide or RNA, e.g. for replacement of a defective gene, delivery of a polypeptide dang or supplementation of a metabolic activity. These genetic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    include cyefic fibrosis, diabetes, cardiovascular disease, cancer or brain malfunction. The non-integrating viral vectors are useful as mucleic acid delivery systems, e.g. for genome analysis or gene therapy and can also be used for applications that involve long-term production of a polypeptide. The non-integrating viral vectors are also useful for creating transgenic host cells that provide normal cells with protection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Non-integrating (adenovirus-based) viral vectors useful in gene therapy, especially for creating patients suffering from a genetic disease, e.g. cystic fibrosis, diabetes, cardiovascular disease, cancer or brain malfunction
                                                                                                                                                                                                                                                                                                                                                                                                                           non-integrating viral vector; cytostatic; anti-diabetic; cardiant; neuroprotective; genetic disease; gene therapy; therapy; cancer; cystic fibrosis; diabetes; cardiovascular disease; brain malfunction; genome analysis; chemotherapy; transgenic host cell; direct repeat; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence of the present invention is a direct repeat sequence that binds to SB protein.

This is a nonamer consensus sequence of a cyclin D transcription factor

DMP1. DMP1 is an amino acid polymer which has binding affinity for a
D-type cyclin, in vitro, and for a specific DM nucleotide sequence and
is a transcription factor involved in the activation of genes that
prevent cell proliferation. The DMP1 nucleic acid is operatively linked
con an expression control sequence in an expression vector. The expression
vector has a transcription control sequence comprising this nonamer
sequence operably associated with a recombinant gene or a cassette
insertion site for a recombinant gene. The vector is homologously
recombined in a chromosome of a transgenic animal. A probe or a
competitor in DMP1 transactivation assays is designed based on this
competitor in DMP1 transactivation assays is designed based on this
confidence. The presence of activity of DMP1 can be determined by
detecting binding of DMP1 and a probe by contacting a biological sample
from a mammal with the probe under conditions that allow binding of the
type presence or activity of DMP1 is suspected in the sample. DMP1 can
chuction as a cell cycle inhibitor when expressed in a tumour cell.
Modulating the expression of DMP1 can be used to treat tumours and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancers. DMP1 can also be used for controlling expression of heterologous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a GAS complement gene promoter motif found in a trophoblast STAT utron (TSU) TSUB be isolated from a CDNA library prepared from mRNA isolated from trophoblast cells. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that stimulates or inhibits a cellular response by sequence specific interactions. The TSU is able to suppress constitutive and interferon-gamma (IFN-gamma) induced major histocompatibility complex (MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    class II antigen expression. The TSU sequence contains motifs related to thrw signalling (OGAS, ISRE and interleukth-4 response elements). The nucleic acid can be used to requiate gene expression in a subject, e.g. a human or a cell in vitro, specifically inhibiting MHC Class I or II,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ICAM-7, B7-1, B7-2, FC gamma R, IL-2 or HIV gene expression. It can be used to inhibit transplant rejection, or treat an autoimmune or inflammatory disease or disorder. It can also be used to inhibit the

The invention describes inhibition of mammalian epithelial cell

proliferation by treating cells with at least one oligonucleotide, or

its fragment. The compounds, which have cytostatic, anti-apsoriatic and

anti-inflammatory, dermatological, ophthalmological, anti-apsoriatic and

immunosuppressive activities, function as 'ultra-violet mimics' to induce

containing or chemicals', as a proliferation inhibitor, apoptosis inducer

contatumour necrosis factor inhibitor. Probably they mimic products of

DNA damage, or processed DNA-damage intermediates, by inducing the p53

containing or processed DNA-damage intermediates, by inducing the p53

containing or processed DNA-damage intermediates, by inducing the p53

containing or transient arrest of cell growth, allowing more time

for DNA repair to occur before cell division takes place. The method is

contained to treat carcinoma but may also be used to: treat other

containing to treat carcinoma but may also be used to: treat other

contained inflammation (atopic or contact dermatitis,

allergically mediated inflammation (atopic or contact dermatitis,

allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in

colls caused by radiation or chemicals; increase melanin production

(pigmentation) in epithelial cells that contain damaged DNA. Also

conjequence apoptosis in response to DNA damage, in epithelial cells

conjequence is melanogenesis associated oligonucleotide #1, one of the

colls production or chemicals, in epithelial cells

conjequence is melanogenesis associated oligonucleotide #1, one of the

colls contained to inhibit mammalian epithelial cell

conjequence is melanogenesis associated oligonucleotide #1, one of the

colls production or contain damages in epithelial cells

colls production or contain damages to DNA damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  XEXEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Melanin, melanogenic; oligomer; cytostatic; anti-allergic; p53; anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; anti-inflammatory; dermatological; proliferation inhibitor; apoptosis; tumour necrosis factor inhibitor; photoaging; hyperproliferative disease; carcinoma; oxidative stress; skin cancer; allergy mediated inflammation; conjunctivitis; allergic rhinitis; vitiligo; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV minetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhintis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA fragments useful for increasing p53 activity in a cell and reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a differential display comprising contacting cDNA with a first primer that hybridies to an oligonucleic sequence coding for a leucine-rich motif, and with a second oligonucleotide primer to form a cDNA-hybrid molecule. The method comprises obtaining mRNA from at least 2 samples, synthesising CDNA from the RNA of each sample, contacting the cDNA with a first primer that hybridises to an oligonucleic sequence coding for a leucine-rich motif, and with a second oligonucleotide primer to form cDNA-hybrid molecules, detecting amplified products and comparing the amplified products from each sample to identify distinctive amplified products coding for at least one secreted or transmembrane protein. The method is useful for discovering novel secreted and/or transmembrane proteins which are important for cell processes and play an important role in determining its phenotype, and which act as mediators for the transfer of signals from external environment into the cell itself, thus modulating gene expression. Sequences ABX03772-ABX03790 represent PCR primers used in the differential display method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Differential display method for identifying secreted or transmembrane protein, comprises contacting a DNA with a first primer that hybridizes to a sequence coding for a leucine-rich motif and with a second oligonucleotide primer -

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) can described site, comprising a first (F1), a second (F2), and a third (F3) target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) designing (I); (2) a polynucleotide (III) encoding (I) or (III); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human the engineering (I), (II) or (III) is useful in a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the carget nucleic acid in a sample, and an assays to determined the carget nucleic acid in a sample, and an assays to secuence affinity and specificity for their target sequences, as well as enhanced biological activity. ABG71213 to ABG72214 and ABP48191 to ABP51230 the properties of the proper
                                                                                                                                                                                                                                                                                                                                                New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Zinc finger protein related oligonucleotide target SEQ ID NO:623.

ABQ71504 standard; DNA; 9 BP.

28-AUG-2002 (first entry)

Zinc finger protein; ZFP; DNA binding protein; zinc finger; ss.

WO200242459-A2

Homo sapiens

//Clone lib="NCI CGAP Pr28"

//Tote="Organ: prostate; Vector: pT773D-Pac (Pharmacia)

with a modified polylinker; Plasmid DNA from the modified library NCI CGAP Pr22 was prepared, and secircles were made in vitro. Following HAP purification, reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 985608-986759, 1101192-1101959, and 1217928-1220615).

Subtraction by Bento Soares and M. Fatima Bonaldo. "a

| Anote="Vector: pr773D-pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pr773 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

Ma are not submitting the same cDNA sequence redundantly to DDBJ
since 1993. For the abundance information of clones with this
sequence in this library and as well as in other 3'-directed
libraries, see 'http://www.imcb.osaka-u.ac.jp/bodymap'. The
sequences of the clones represented by this GS sequences is also
found there.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gij 473214 glp hR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR123072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 174,

| Patent No. 6489458
| GENERAL INFORMATION:
| APPLICANT: HACKETT ET AL.
| TITLE OF INVENTION: DNA-BASED TRANSPOSON SYSTEM FOR THE
| TITLE OF INVENTION: INTRODUCTION OF NUCLEIC ACID INTO DNA OF A CELL
| NUMBER OF SEQUENCES: 63
| CORRESPONDENCE ADDRESS: 64
| STREET: 119 NORTH FOURTH STREET, SUITE 203
| CITY: MINNEADLS
| CONTRY: USA
| CONTRY: USA
| CONTRY: USA
| COMPUTER READABLE FORM: 64
| COMPUTER: Floppy disk
| COMPUTER: Floppy disk
| COMPUTER: IBM PC Compatible | COMPUTER: COMPUTER: PLOPS/MS-DOS | COMPUTER: PLOP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GENERAL INFORMATION:
APPLICANT: Gilchrest, Barbara A.
APPLICANT: Gilchrest, Mark
APPLICANT: Biler, Mark
TITLE OF INVENTION: Use of Locally Applied DNA Fragments
FILE REFERENCE: BU94-68A2

GENERAL INCURANTION:

APPLICANT: Wang, David G.

TITLE OF INVENTION: Identification and Mapping of Single Nucleotide
ITLE OF INVENTION: Polymorphisms in the Human Genome
FILE REFERENCE: 10827.129
CURRENT FILING DATE: 2002-04-30
FRIOR PILING DATE: 2000-07-12
PRIOR PLICATION NUMBER: US 60/198,676
PRIOR FILING DATE: 2000-04-20

Sequence 4, Application US/08747121
Patent No. 5874290
GENERAL INFORMATION:
APPLICANT: Murphy, Gerald
APPLICANT: Boynton, Alton
APPLICANT: Schgal, Ani
TITLE OF INVENTION: NUCLEOTIDE AND AMINO ACID
TITLE OF INVENTION: SEQUENCES OF A D2-2 GENE ASSOCIATED WITH
TITLE OF INVENTION: BRAIN TUMORS AND METHODS BASED THEREON
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COMPUTER READABLE FORM:
